# Before you start

This checklist applies to every intern on every track. Complete it before submitting any task.

## Profile & setup (do this first)

01 Complete your LinkedIn profile. If you need help, search “LinkedIn profile optimization and resume building” on YouTube and watch a tutorial before starting any project work.

02 Search “how to build a personal portfolio” on YouTube and watch a walkthrough — a simple portfolio makes your internship work easy to showcase.

03 Create your GitHub repository. Name it exactly: KELBARI (all caps). This single repository holds all your task submissions across the internship. Do not create a separate repo per task.

04 Connect your GitHub account and make sure your profile is public so mentors can review your work.

## Per-task workflow (repeat for every task)

01 Step 1 — Review. Read the task card for your chosen task carefully. Understand the full feature checklist before writing a single line of code or starting a design.

02 Step 2 — Build. Develop your project, following the tech stack and requirements in the task card.

03 Step 3 — Push to GitHub. Commit your completed project to your KELBARI repository using this folder format, with no exceptions: KELBARI/[Track]-[Level or Task]-[ProjectName]/ — for example KELBARI/WebDev-L1-LandingPage/ or KELBARI/Python-Task2-BMICalculator/. Each folder must contain your source code, a README.md describing the project, and any relevant screenshots or output files.

04 Step 4 — Record a demo video. Record a short screen walkthrough of your finished project. Begin with a 2-second title card showing (1) your full name, (2) your track, and (3) the task title. After the title card, show the project working end to end — not just screenshots. For report-based tasks, narrate your document on screen.

05 Step 5 — Post to LinkedIn. Share your demo video in a LinkedIn post. Tag Kelbari and include the hashtag #kelbari, plus relevant domain hashtags (for example #webdevelopment, #datascience, #python, #cybersecurity, #internship).

06 Step 6 — Engage with peers. Watch the LinkedIn demo videos of at least two other interns from your cohort and leave a thoughtful comment on each — engage with their work, ask a question, or offer a constructive observation. Generic comments like “Great work!” don't count.

07 Step 7 — Submit. Submit your task through the submission form shared with you by Kelbari, including your GitHub repository link.

08 Step 8 — Evaluation. After the submission deadline, your work is reviewed. On successful completion you receive your Kelbari Completion Certificate and, where applicable, a Letter of Recommendation.

## Key reminders

01 GitHub repo name must be exactly KELBARI (all caps) — any other name may cause your submission to be missed.

02 Follow the strict folder format KELBARI/[Track]-[Level or Task]-[ProjectName]/ — inconsistent naming delays review.

03 The first 2 seconds of every demo video must show your full name, track and task title as a static frame.

04 Thoughtful comments on at least two fellow interns' videos are required for completion.

05 Check your track's completion rule below and don't under-submit.

06 All work must be entirely your own. Plagiarism or copied work leads to cancellation of your submission and certificate.

## What you receive from Kelbari

01 Guidance and mentorship from the Kelbari team throughout the program.

02 A Certificate of Completion once you finish your track's requirements.

03 For top performers: a Letter of Recommendation, a letter of appreciation, and a pathway to a job or paid role at Kelbari and related opportunities.

# 📱 Android App Development

**Completion rule.** Complete at least 3 of the 5 tasks below.

TASK 1

## Unit Converter Application

**Objective.** Build an Android app that converts values between common units of measurement (length, weight, volume, etc.).

`Tech: Android Studio, Java, XML`

FEATURE CHECKLIST

- [ ] Input field for the numeric value
- [ ] Spinner to select the source unit
- [ ] Spinner to select the target unit
- [ ] Convert button that computes and displays the result
- [ ] Result TextView with a unit label
- [ ] At least 3 categories: length, weight and one more (temperature, volume, speed…)
- [ ] Input validation with a Toast if empty or non-numeric
- [ ] Category selector that resets the unit dropdowns

> **Where to learn:** Search “Android unit converter app tutorial Java XML” on YouTube. Reference developer.android.com for Spinner, EditText and Toast. A simple search gives any conversion formula.

TASK 2

# To-Do App with Login

**Objective.** Build a secure task app where users register and log in before accessing their personal to-do lists, with data stored locally.

```
Tech: Android Studio, Java, XML, SQLite
```

### FEATURE CHECKLIST

- [ ] Login screen (email/username + password)
- [ ] Sign-up screen (name, email, password)
- [ ] Passwords hashed in SQLite (no plain text)
- [ ] Logout that returns to login and clears the session
- [ ] Task list screen for the logged-in user
- [ ] “Add Task” dialog or screen for a name and optional notes
- [ ] Mark tasks complete (strikethrough or a completed section)
- [ ] Delete tasks permanently
- [ ] SQLite stores tasks per user account
- [ ] Friendly empty-state message

> **Where to learn:** Search “Android SQLite login register Java tutorial” on YouTube. Reference the Android docs for SQLiteOpenHelper. For hashing without libraries, search “Android SHA password hashing Java”.

TASK 3

## Calculator

**Objective.** Build a clean, fully functional Android calculator with a responsive button grid.

`Tech: Android Studio, Java, XML`

FEATURE CHECKLIST

- [ ] Display TextView showing input and result
- [ ] Number buttons (0–9) and a decimal point
- [ ] Operator buttons: +, −, ×, ÷
- [ ] Equals (=) to evaluate
- [ ] Clear (C) to reset
- [ ] Backspace to delete the last character
- [ ] Division-by-zero shows “Error”
- [ ] Button grid via GridLayout or ConstraintLayout
- [ ] No crashes on rapid taps

> **Where to learn:** Search “Android calculator app Java tutorial beginners” on YouTube. Reference the Android docs for GridLayout, TextView and OnClickListener. Use a StringBuilder to build the expression.

TASK 4

## Quiz Application

**Objective.** Build a multiple-choice quiz app on a topic of your choice. Users answer one question at a time and see a final score.

`Tech: Android Studio, Java, XML`

FEATURE CHECKLIST

- [ ] Welcome screen with a Start button
- [ ] Question screen: question text, 4 options, and a counter (“Question 3 of 10”)
- [ ] At least 10 questions, hardcoded or from a local JSON/array
- [ ] Immediate feedback: correct in green, wrong in red
- [ ] “Next” button
- [ ] Score tracking throughout
- [ ] Results screen: score, correct, incorrect, and “Restart”
- [ ] Questions shuffled each time (ideal)

> **Where to learn:** Search “Android quiz app Java tutorial” on YouTube. For questions, use OpenTriviaDB (opentdb.com) or hardcode 10. Reference the docs for RadioGroup, Intent and Bundle.

TASK 5

## Stopwatch

**Objective.** Build a functional stopwatch with start, pause and reset that accurately tracks elapsed time.

`Tech: Android Studio, Java, XML`

FEATURE CHECKLIST

- [ ] Large time display (HH:MM:SS or MM:SS:ms)
- [ ] Start button (from 0 or from pause)
- [ ] Stop/Pause button that freezes the time
- [ ] Reset button to 00:00:00
- [ ] Buttons change state visually when running
- [ ] Timer survives navigating away and back (handle onPause/onResume)
- [ ] (Bonus) Lap button recording times to a scrollable list

> **Where to learn:** Search “Android stopwatch app Java Handler tutorial”. The standard approach uses Handler and Runnable. Reference the docs on Processes and threads and the Activity lifecycle.

## Contact & support

Questions during your internship? Reach the Kelbari team here.
