Kelbari

Internship Program · 2026

Web Development & Design internship.

A guided, portfolio-building track. Pick your tasks, build real projects, and share your work. Top performers can earn a Letter of Recommendation and a pathway to a job at Kelbari. One connected team for web development, digital marketing and graphic design, based in Bahawalpur, Pakistan.

Level 1 | Level 2 | Level 3

Track guide & task cards
kelbari.net

Apply via the form in our
Kelbari LinkedIn post

Before you start

This checklist applies to every intern on every track. Complete it before submitting any task.

Profile & setup (do this first)

01 Complete your LinkedIn profile. If you need help, search “LinkedIn profile optimization and resume building” on YouTube and watch a tutorial before starting any project work.

02 Search “how to build a personal portfolio” on YouTube and watch a walkthrough — a simple portfolio makes your internship work easy to showcase.

03 Create your GitHub repository. Name it exactly: KELBARI (all caps). This single repository holds all your task submissions across the internship. Do not create a separate repo per task.

04 Connect your GitHub account and make sure your profile is public so mentors can review your work.

Per-task workflow (repeat for every task)

01 Step 1 — Review. Read the task card for your chosen task carefully. Understand the full feature checklist before writing a single line of code or starting a design.

02 Step 2 — Build. Develop your project, following the tech stack and requirements in the task card.

03 Step 3 — Push to GitHub. Commit your completed project to your KELBARI repository using this folder format, with no exceptions: KELBARI/[Track]-[Level or Task]-[ProjectName]/ — for example KELBARI/WebDev-L1-LandingPage/ or KELBARI/Python-Task2-BMICalculator/. Each folder must contain your source code, a README.md describing the project, and any relevant screenshots or output files.

04 Step 4 — Record a demo video. Record a short screen walkthrough of your finished project. Begin with a 2-second title card showing (1) your full name, (2) your track, and (3) the task title. After the title card, show the project working end to end — not just screenshots. For report-based tasks, narrate your document on screen.

05 Step 5 — Post to LinkedIn. Share your demo video in a LinkedIn post. Tag Kelbari and include the hashtag #kelbari, plus relevant domain hashtags (for example #webdevelopment, #datascience, #python, #cybersecurity, #internship).

06 Step 6 — Engage with peers. Watch the LinkedIn demo videos of at least two other interns from your cohort and leave a thoughtful comment on each — engage with their work, ask a question, or offer a constructive observation. Generic comments like “Great work!” don't count.

07 Step 7 — Submit. Submit your task through the submission form shared with you by Kelbari, including your GitHub repository link.

08 Step 8 — Evaluation. After the submission deadline, your work is reviewed. On successful completion you receive your Kelbari Completion Certificate and, where applicable, a Letter of Recommendation.

Key reminders

01 GitHub repo name must be exactly KELBARI (all caps) — any other name may cause your submission to be missed.

02 Follow the strict folder format KELBARI/[Track]-[Level or Task]-[ProjectName]/ — inconsistent naming delays review.

03 The first 2 seconds of every demo video must show your full name, track and task title as a static frame.

04 Thoughtful comments on at least two fellow interns' videos are required for completion.

05 Check your track's completion rule below and don't under-submit.

06 All work must be entirely your own. Plagiarism or copied work leads to cancellation of your submission and certificate.

What you receive from Kelbari

01 Guidance and mentorship from the Kelbari team throughout the program.

02 A Certificate of Completion once you finish your track's requirements.

03 For top performers: a Letter of Recommendation, a letter of appreciation, and a pathway to a job or paid role at Kelbari and related opportunities.

🌐 Web Development & Design

Completion rule. Complete ALL tasks within one chosen Level (Level 1, 2, or 3). Level 3 is a single, complex full-stack project — choose your level based on your current skill set.

Level 1

LEVEL 1 · TASK 1

Landing Page

Objective. Build a visually polished static landing page for a product, service, or brand of your choice. This establishes foundational HTML/CSS layout skills.

`Tech: HTML5, CSS3 (no JavaScript required)`

FEATURE CHECKLIST

- [ ] Fixed or sticky navigation bar with at least 3 links
- [ ] Hero section with a headline, subheadline and a call-to-action button
- [ ] At least 2 distinct content sections (e.g. Features, About, Testimonials)
- [ ] Footer with placeholder contact/social links
- [ ] Consistent colour palette across all sections
- [ ] Responsive layout that does not break at mobile widths (use Flexbox or Grid)
- [ ] No element overlap — padding, margin and box-sizing intentionally set
- [ ] Clean, readable typography with at least 2 font sizes (heading vs body)

> **Where to learn:** Search “landing page HTML CSS tutorial beginner” on YouTube for a walkthrough. Browse Dribbble or Awwwards (search “landing page design”) for visual inspiration — study layout principles, don't copy.

LEVEL 1 · TASK 2

Personal Portfolio

Objective. Create a personal portfolio website that showcases your skills, projects and contact information — effectively your digital résumé.

```
Tech: HTML5, CSS3 (JavaScript optional)
```

FEATURE CHECKLIST

- [ ] Profile/hero section: your name, role title and a professional photo or avatar placeholder
- [ ] About Me section: 2–3 sentences on your background and interests
- [ ] Skills section: a visual grid or list of your technical skills
- [ ] Projects section: at least 2 project cards (title, description, GitHub link placeholder)
- [ ] Contact section: name, email and optional LinkedIn/GitHub icons
- [ ] Smooth scroll navigation between sections
- [ ] Consistent branding (colours, fonts) throughout
- [ ] Fully responsive on desktop and mobile

> **Where to learn:** Search “personal portfolio website HTML CSS GitHub” on YouTube and watch a tutorial. Use Google Fonts (fonts.google.com) for free typography. Search “portfolio design inspiration 2026” on Pinterest or Dribbble for layout ideas.

LEVEL 1 · TASK 3

Temperature Converter Website

Objective. Build an interactive web tool that converts temperature values between Celsius, Fahrenheit and (optionally) Kelvin, with real-time input validation.

```
Tech: HTML5, CSS3, JavaScript (Vanilla)
```

FEATURE CHECKLIST

- [ ] Numeric input field that rejects non-numeric input with an error message
- [ ] Unit selector (dropdown or radio buttons) for the input unit
- [ ] Output showing all converted units with correct labels
- [ ] Convert button that triggers the calculation
- [ ] Result display area with correct unit labels
- [ ] Edge-case handling for absolute-zero violations (below −273.15°C)
- [ ] Clean, centred UI with clear labels

> **Where to learn:** Search “temperature converter JavaScript tutorial” on YouTube for the conversion formulas. Read the MDN Web Docs article on HTML input validation for the input-checking approach.

Level 2

LEVEL 2 · TASK 1

Calculator

Objective. Build a fully functional browser-based calculator for basic arithmetic with a user-friendly button interface.

```
Tech: HTML5, CSS3, JavaScript (Vanilla)
```

FEATURE CHECKLIST

- [ ] Display screen showing current input and result
- [ ] Numeric buttons (0–9) and a decimal point
- [ ] Operator buttons: +, −, ×, ÷
- [ ] Equals (=) button to evaluate
- [ ] Clear (C) button to reset
- [ ] Backspace button to remove the last character
- [ ] Division-by-zero handled with a message, not a crash
- [ ] Operator chaining (e.g. 5 + 3 × 2) without a full reset
- [ ] CSS Grid for button layout
- [ ] Event listeners on all buttons (no inline onclick)

> **Where to learn:** Search “vanilla JavaScript calculator project tutorial” on YouTube. Reference MDN for addEventListener, switch statements and parseFloat(). Build your own logic rather than using eval().

LEVEL 2 · TASK 2

Tribute Page

Objective. Design a visually engaging tribute page for a historical figure, scientist, artist or public figure you admire.

`Tech: HTML5, CSS3 (JavaScript optional)`

FEATURE CHECKLIST

- [ ] Page title with the subject's name and a one-line tagline
- [ ] A prominent royalty-free image (Unsplash or Wikimedia Commons)
- [ ] A biography/tribute section: 3–4 paragraphs of original writing
- [ ] A timeline or key-achievements section
- [ ] A distinctly styled quote block
- [ ] At least 2 background colours across sections
- [ ] At least 2 font styles (e.g. serif headings, sans-serif body)
- [ ] Responsive layout

> **Where to learn:** Use Wikipedia or Britannica to research your subject (paraphrase, don't copy). Source images from Unsplash or Wikimedia Commons. Search “HTML CSS tribute page freeCodeCamp” for structure.

LEVEL 2 · TASK 3

To-Do Web App

Objective. Develop an interactive to-do list that lets users add, complete, edit and delete tasks, organised into pending and completed lists.

```
Tech: HTML5, CSS3, JavaScript (Vanilla or a small library like Alpine.js)
```

FEATURE CHECKLIST

- [ ] Input field + “Add Task” button
- [ ] New tasks appear immediately in the Pending list
- [ ] “Mark Complete” toggle moves tasks to the Completed list
- [ ] Inline Edit button on each task
- [ ] Delete button that permanently removes a task
- [ ] Task counts: “X pending” and “Y completed”
- [ ] (Bonus) Timestamp on each task
- [ ] (Bonus) Tasks persist across refreshes using localStorage
- [ ] Friendly empty-state message when a list is empty

> **Where to learn:** Search “JavaScript to-do list app tutorial DOM manipulation” on YouTube. For persistence, search “localStorage JavaScript beginners guide MDN”. Read GitHub repos tagged “todo-app vanilla-js” for architecture (read, don't copy).

LEVEL 2 · TASK 4

Login Authentication System

Objective. Build a simple authentication system with user registration, login validation and a protected page.

```
Tech: Choose one: (A) front-end only with HTML/CSS/JS + localStorage, (B) full-stack Node.js + Express + JSON/SQLite, or (C) Python Flask with sessions.
```

FEATURE CHECKLIST

- [ ] Registration page with username/email and password fields
- [ ] Password rule on registration: at least 8 characters, at least 1 number
- [ ] Duplicate username/email check with an error
- [ ] Login page with username/email and password
- [ ] Incorrect-credential handling with a clear error (don't reveal which field is wrong)
- [ ] Protected dashboard page, accessible only after login; redirect to login if accessed directly
- [ ] Logout button that clears the session and returns to login
- [ ] Passwords never stored in plain text — use hashing (bcrypt for Node/Python, or SHA-256 client-side)
- [ ] Basic form validation (no empty submissions)

> **Where to learn:** Search “login authentication JavaScript localStorage tutorial” for the front-end path, or “Node.js Express login bcrypt tutorial” for full-stack. Read the MDN article on HTTP cookies and sessions.

Level 3

LEVEL 3 · TASK 1

Food Ordering Full-Stack Application

⚠️ Level 3 is a single, complex full-stack project. It needs solid knowledge of React, Node.js, a database and API integration. Don't choose it unless you're comfortable with all of these.

Objective. Build a production-grade, full-stack food ordering and inventory platform with separate Admin and User roles, real-time order tracking, test-mode payments and automated stock alerts.

```
Tech: React.js (frontend), Node.js + Express.js (backend), MongoDB
(database), Stripe test mode or a sandbox payment gateway
```

FEATURE CHECKLIST

- [ ] User registration with email verification
- [ ] User login with JWT-based authorisation
- [ ] Forgot-password flow (email reset link)
- [ ] Dashboard of available items
- [ ] Custom order builder: choose a base, a sauce, a cheese, and multiple toppings
- [ ] Order summary page before payment
- [ ] Payment gateway checkout in test mode (a “Success” click confirms the order)
- [ ] Real-time order status on the user dashboard (Received → In Kitchen → Out for Delivery)
- [ ] Separate admin login (not reachable from user registration)
- [ ] Inventory dashboard with current stock of each ingredient
- [ ] Stock auto-decremented after each order, plus manual stock updates
- [ ] Automated email alert to admin when any item falls below a threshold (use a scheduled job such as node-cron)
- [ ] Order management panel to view orders and update status, reflected in real time on the user dashboard (polling or WebSockets)

> **Where to learn:** Search “MERN stack full project tutorial” on YouTube for end-to-end architecture. For payments, follow the official docs of your chosen test-mode gateway. For emails and scheduling, search “nodemailer tutorial” and “node-cron scheduled jobs”.
