Kelbari

Internship Program · 2026

🐍 Data Science internship.

A guided, portfolio-building track. Pick your tasks, build real projects, and share your work. Top performers can earn a Letter of Recommendation and a pathway to a job at Kelbari. One connected team for web development, digital marketing and graphic design, based in Bahawalpur, Pakistan.

Track guide & task cards
kelbari.net

Apply via the form in our
Kelbari LinkedIn post

Before you start

This checklist applies to every intern on every track. Complete it before submitting any task.

Profile & setup (do this first)

01 Complete your LinkedIn profile. If you need help, search “LinkedIn profile optimization and resume building” on YouTube and watch a tutorial before starting any project work.

02 Search “how to build a personal portfolio” on YouTube and watch a walkthrough — a simple portfolio makes your internship work easy to showcase.

03 Create your GitHub repository. Name it exactly: KELBARI (all caps). This single repository holds all your task submissions across the internship. Do not create a separate repo per task.

04 Connect your GitHub account and make sure your profile is public so mentors can review your work.

Per-task workflow (repeat for every task)

01 Step 1 — Review. Read the task card for your chosen task carefully. Understand the full feature checklist before writing a single line of code or starting a design.

02 Step 2 — Build. Develop your project, following the tech stack and requirements in the task card.

03 Step 3 — Push to GitHub. Commit your completed project to your KELBARI repository using this folder format, with no exceptions: KELBARI/[Track]-[Level or Task]-[ProjectName]/ — for example KELBARI/WebDev-L1-LandingPage/ or KELBARI/Python-Task2-BMICalculator/. Each folder must contain your source code, a README.md describing the project, and any relevant screenshots or output files.

04 Step 4 — Record a demo video. Record a short screen walkthrough of your finished project. Begin with a 2-second title card showing (1) your full name, (2) your track, and (3) the task title. After the title card, show the project working end to end — not just screenshots. For report-based tasks, narrate your document on screen.

05 Step 5 — Post to LinkedIn. Share your demo video in a LinkedIn post. Tag Kelbari and include the hashtag #kelbari, plus relevant domain hashtags (for example #webdevelopment, #datascience, #python, #cybersecurity, #internship).

06 Step 6 — Engage with peers. Watch the LinkedIn demo videos of at least two other interns from your cohort and leave a thoughtful comment on each — engage with their work, ask a question, or offer a constructive observation. Generic comments like “Great work!” don't count.

07 Step 7 — Submit. Submit your task through the submission form shared with you by Kelbari, including your GitHub repository link.

08 Step 8 — Evaluation. After the submission deadline, your work is reviewed. On successful completion you receive your Kelbari Completion Certificate and, where applicable, a Letter of Recommendation.

Key reminders

01 GitHub repo name must be exactly KELBARI (all caps) — any other name may cause your submission to be missed.

02 Follow the strict folder format KELBARI/[Track]-[Level or Task]-[ProjectName]/ — inconsistent naming delays review.

03 The first 2 seconds of every demo video must show your full name, track and task title as a static frame.

04 Thoughtful comments on at least two fellow interns' videos are required for completion.

05 Check your track's completion rule below and don't under-submit.

06 All work must be entirely your own. Plagiarism or copied work leads to cancellation of your submission and certificate.

What you receive from Kelbari

01 Guidance and mentorship from the Kelbari team throughout the program.

02 A Certificate of Completion once you finish your track's requirements.

03 For top performers: a Letter of Recommendation, a letter of appreciation, and a pathway to a job or paid role at Kelbari and related opportunities.

🐍 Data Science

Completion rule. Complete at least 3 of the 5 tasks below.

TASK 1

Iris Flower Classification

Objective. Train a classification model to identify the species of an iris flower (Setosa, Versicolor or Virginica) from its measurements.

`Tech: Python, scikit-learn, pandas, matplotlib/seaborn, Jupyter`

FEATURE CHECKLIST

- [ ] Load the Iris dataset (built into sklearn — no download)
- [ ] EDA: shape, dtypes, null check, descriptive statistics
- [ ] Visualisations: pairplot by species and box plots per feature
- [ ] Feature-selection discussion: which features are most discriminative?
- [ ] Train/test split (typically 80/20)
- [ ] Train at least 2 classifiers (e.g. Logistic Regression, KNN, Decision Tree, Random Forest)
- [ ] Evaluate each: accuracy, confusion matrix, classification report
- [ ] Declare the best model with justification
- [ ] Clean, commented notebook

> **Where to learn:** The dataset is built into scikit-learn. Search “Iris classification Python scikit-learn tutorial” on YouTube. Reference the scikit-learn User Guide and “seaborn pairplot tutorial”.

TASK 2

Unemployment Analysis with Python

Objective. Perform EDA on unemployment data to uncover regional and temporal trends, including the impact of the COVID-19 period.

`Tech: Python, pandas, matplotlib, seaborn, Jupyter`

FEATURE CHECKLIST

- [ ] Load a suitable dataset (see resources)
- [ ] Data loading, shape inspection, null check, type conversion
- [ ] EDA: region-wise average rates and month-wise trends
- [ ] Time-series line chart for at least 3 regions
- [ ] Bar chart: top 10 regions by average unemployment
- [ ] Heatmap of related rates
- [ ] Before vs after comparison across a chosen date split
- [ ] Markdown observations between charts
- [ ] Clean, commented notebook

> **Where to learn:** Search “unemployment rate dataset” on Kaggle (free account). Search “pandas time series analysis tutorial” and “seaborn heatmap tutorial” on YouTube.

TASK 3

Car Price Prediction

Objective. Build a regression model that predicts a used car's selling price from features like brand, age, mileage, fuel type and transmission.

`Tech: Python, pandas, scikit-learn, matplotlib, seaborn, Jupyter`

FEATURE CHECKLIST

- [ ] Load a suitable dataset
- [ ] Data cleaning: nulls, duplicates, inconsistent categories
- [ ] Feature engineering: car age from year; brand from name
- [ ] EDA: price distribution, price vs fuel type, price vs age
- [ ] Encode categorical variables
- [ ] Correlation heatmap
- [ ] Train/test split
- [ ] Train at least 2 regression models (Linear Regression, Random Forest, Gradient Boosting)
- [ ] Evaluate with MAE, RMSE and R^2
- [ ] Feature-importance chart for your best model
- [ ] Clean, commented notebook

> **Where to learn:** Search “car price prediction dataset” on Kaggle. Search “car price prediction Python machine learning tutorial” on YouTube.

TASK 4

Email Spam Detection

Objective. Build an NLP binary classifier that distinguishes spam from legitimate (ham) emails.

```
Tech: Python, pandas, scikit-learn (TF-IDF, Naive Bayes/SVM), NLTK, Jupyter
```

FEATURE CHECKLIST

- [ ] Load a suitable dataset
- [ ] Class distribution check (spam vs ham)
- [ ] Text preprocessing: lowercase, punctuation removal, stopword removal, optional stemming
- [ ] TF-IDF feature extraction (explain what TF-IDF measures)
- [ ] Train/test split
- [ ] Train at least 2 classifiers: Multinomial Naive Bayes + one alternative
- [ ] Evaluate: accuracy, precision, recall, F1, confusion matrix
- [ ] Discuss why recall matters for spam detection
- [ ] (Bonus) WordClouds for spam and ham
- [ ] Clean, commented notebook

> **Where to learn:** Search “SMS spam collection dataset” on Kaggle or the UCI ML Repository. Search “email spam detection Python NLP tutorial scikit-learn” on YouTube. Reference the NLTK docs.

TASK 5

Sales Prediction Using Python

Objective. Build a regression model that predicts product sales from advertising spend across TV, radio and newspaper.

```
Tech: Python, pandas, scikit-learn, matplotlib, seaborn, Jupyter
```

FEATURE CHECKLIST

- [ ] Load a suitable dataset
- [ ] EDA: null check, descriptive statistics, pairplot
- [ ] Scatter plots: sales vs each channel
- [ ] Correlation heatmap
- [ ] Train/test split
- [ ] Linear Regression baseline
- [ ] At least one additional model (Random Forest, Polynomial Regression)
- [ ] Evaluate with MAE, RMSE, R^2
- [ ] Residual plot for the best model
- [ ] Interpretation: which channel has the highest impact?
- [ ] Clean, commented notebook

> **Where to learn:** Search “advertising sales prediction dataset” on Kaggle. Search “sales prediction linear regression Python tutorial” on YouTube. Reference scikit-learn for LinearRegression and the metrics.
