Kelbari

Internship Program · 2026

🎯 Python Programming internship.

A guided, portfolio-building track. Pick your tasks, build real projects, and share your work. Top performers can earn a Letter of Recommendation and a pathway to a job at Kelbari. One connected team for web development, digital marketing and graphic design, based in Bahawalpur, Pakistan.

Track guide & task cards
kelbari.net

Apply via the form in our
Kelbari LinkedIn post

Before you start

This checklist applies to every intern on every track. Complete it before submitting any task.

Profile & setup (do this first)

01 Complete your LinkedIn profile. If you need help, search “LinkedIn profile optimization and resume building” on YouTube and watch a tutorial before starting any project work.

02 Search “how to build a personal portfolio” on YouTube and watch a walkthrough — a simple portfolio makes your internship work easy to showcase.

03 Create your GitHub repository. Name it exactly: KELBARI (all caps). This single repository holds all your task submissions across the internship. Do not create a separate repo per task.

04 Connect your GitHub account and make sure your profile is public so mentors can review your work.

Per-task workflow (repeat for every task)

01 Step 1 — Review. Read the task card for your chosen task carefully. Understand the full feature checklist before writing a single line of code or starting a design.

02 Step 2 — Build. Develop your project, following the tech stack and requirements in the task card.

03 Step 3 — Push to GitHub. Commit your completed project to your KELBARI repository using this folder format, with no exceptions: KELBARI/[Track]-[Level or Task]-[ProjectName]/ — for example KELBARI/WebDev-L1-LandingPage/ or KELBARI/Python-Task2-BMICalculator/. Each folder must contain your source code, a README.md describing the project, and any relevant screenshots or output files.

04 Step 4 — Record a demo video. Record a short screen walkthrough of your finished project. Begin with a 2-second title card showing (1) your full name, (2) your track, and (3) the task title. After the title card, show the project working end to end — not just screenshots. For report-based tasks, narrate your document on screen.

05 Step 5 — Post to LinkedIn. Share your demo video in a LinkedIn post. Tag Kelbari and include the hashtag #kelbari, plus relevant domain hashtags (for example #webdevelopment, #datascience, #python, #cybersecurity, #internship).

06 Step 6 — Engage with peers. Watch the LinkedIn demo videos of at least two other interns from your cohort and leave a thoughtful comment on each — engage with their work, ask a question, or offer a constructive observation. Generic comments like “Great work!” don't count.

07 Step 7 — Submit. Submit your task through the submission form shared with you by Kelbari, including your GitHub repository link.

08 Step 8 — Evaluation. After the submission deadline, your work is reviewed. On successful completion you receive your Kelbari Completion Certificate and, where applicable, a Letter of Recommendation.

Key reminders

01 GitHub repo name must be exactly KELBARI (all caps) — any other name may cause your submission to be missed.

02 Follow the strict folder format KELBARI/[Track]-[Level or Task]-[ProjectName]/ — inconsistent naming delays review.

03 The first 2 seconds of every demo video must show your full name, track and task title as a static frame.

04 Thoughtful comments on at least two fellow interns' videos are required for completion.

05 Check your track's completion rule below and don't under-submit.

06 All work must be entirely your own. Plagiarism or copied work leads to cancellation of your submission and certificate.

What you receive from Kelbari

01 Guidance and mentorship from the Kelbari team throughout the program.

02 A Certificate of Completion once you finish your track's requirements.

03 For top performers: a Letter of Recommendation, a letter of appreciation, and a pathway to a job or paid role at Kelbari and related opportunities.

🎯 Python Programming

Completion rule. Complete at least 3 of the 5 tasks below. Each task has a Beginner and an Advanced tier — choose the depth that matches your level. Both tiers count for completion.

TASK 1

Voice Assistant

Objective. Build a voice assistant that listens to spoken commands and responds with useful actions.

```
Tech: Beginner: Python, speech_recognition, pyttsx3, datetime, webbrowser.
Advanced adds: nltk/transformers, third-party APIs, smtplib
```

FEATURE CHECKLIST

- [ ] Beginner — capture voice input via speech_recognition
- [ ] Beginner — greet on “Hello”; tell current time and date
- [ ] Beginner — web search on a spoken topic; text-to-speech responses; ask to repeat if not understood
- [ ] Advanced — parse intent from free-form sentences (not just keywords)
- [ ] Advanced — send email by voice via smtplib (test account)
- [ ] Advanced — timed reminder with an audible alert
- [ ] Advanced — live weather via a weather API; answer general-knowledge questions
- [ ] Advanced — custom commands via a config file; document what data is processed in the README

> **Where to learn:** Search “Python voice assistant tutorial speech_recognition pyttsx3” on YouTube for the beginner path. For advanced, search “Python NLP chatbot intent recognition tutorial” and “OpenWeatherMap API Python tutorial”. Get a free key at openweathermap.org.

TASK 2

BMI Calculator

Objective. Calculate a user's Body Mass Index and classify it into health categories.

```
Tech: Beginner: Python, input(), arithmetic. Advanced: tkinter/PyQt5,
matplotlib, sqlite3 or CSV
```

FEATURE CHECKLIST

- [ ] Beginner — prompt for weight (kg) and height (m)
- [ ] Beginner — compute BMI = weight / height²
- [ ] Beginner — classify: Underweight, Normal, Overweight, Obese
- [ ] Beginner — show BMI to 2 decimals and the category; reject non-numeric/negative input
- [ ] Advanced — tkinter/PyQt5 GUI, no command line
- [ ] Advanced — labelled input fields and a Calculate button
- [ ] Advanced — colour-coded result
- [ ] Advanced — multi-user records saved in SQLite or CSV
- [ ] Advanced — matplotlib line chart of a user's BMI trend; handle read/write errors

> **Where to learn:** Search “Python BMI calculator command line tutorial”. For advanced, search “Python tkinter GUI tutorial beginners” and “Python matplotlib line chart tutorial”. For storage, search “Python sqlite3 tutorial CRUD”.

TASK 3

Random Password Generator

Objective. Generate strong, random passwords based on user-defined criteria.

```
Tech: Beginner: Python, random, string. Advanced: secrets, tkinter/PyQt5, pyperclip
```

FEATURE CHECKLIST

- [ ] Beginner — prompt for length (minimum 8 enforced)
- [ ] Beginner — choose character types (at least 2 of: upper, lower, numbers, symbols)
- [ ] Beginner — generate and display a password meeting all criteria; validate input; generate another without restarting
- [ ] Advanced — GUI with sliders/spinboxes and checkboxes
- [ ] Advanced — use the secrets module (not random) for secure generation
- [ ] Advanced — strength indicator (Weak/Medium/Strong)
- [ ] Advanced — guarantee one character from each selected type; optional exclude of ambiguous characters
- [ ] Advanced — “Copy to Clipboard” via pyperclip; show the last 5 generated in-session (not saved to file)

> **Where to learn:** Search “Python password generator tutorial” on YouTube. For advanced, search “Python tkinter password generator GUI” and “Python secrets module vs random”. Use the secrets module for anything security-related.

TASK 4

Basic Weather App

Objective. Fetch and display real-time weather for a user-specified location using a weather API.

```
Tech: Beginner: Python, requests, json, OpenWeatherMap. Advanced: +
tkinter/PyQt5, Pillow
```

FEATURE CHECKLIST

- [ ] Beginner — prompt for a city name or ZIP
- [ ] Beginner — call the API and parse the JSON
- [ ] Beginner — show temperature (°C and °F), humidity, condition and wind speed
- [ ] Beginner — handle city-not-found, timeout and invalid-key errors; reject empty input
- [ ] Advanced — GUI with input, a button and a results panel
- [ ] Advanced — weather icons for the current condition
- [ ] Advanced — 6-hour and 5-day forecast panels; Celsius/Fahrenheit toggle
- [ ] Advanced — (bonus) auto-locate via IP; show errors inside the GUI

> **Where to learn:** Register for a free key at openweathermap.org (free tier is enough). Search “Python weather app OpenWeatherMap API tutorial” on YouTube. For a GUI, search “Python tkinter weather app tutorial”.

TASK 5

Chat Application

Objective. Build a real-time messaging app in Python.

```
Tech: Beginner: Python, socket, threading. Advanced: socket/asyncio or
Flask-SocketIO, tkinter or a web framework, sqlite3
```

FEATURE CHECKLIST

- [ ] Beginner — server that listens for client connections
- [ ] Beginner — client that connects to the server
- [ ] Beginner — real-time two-way messaging between two clients
- [ ] Beginner — messages with a timestamp prefix; graceful disconnect notice; runs on localhost
- [ ] Advanced — GUI (tkinter) or a Flask web app
- [ ] Advanced — registration and login stored in SQLite
- [ ] Advanced — multiple named chat rooms; message history loaded on join
- [ ] Advanced — notification for new messages when unfocused; emoji shortcode rendering; document what is and isn't encrypted in the README

> **Where to learn:** Search “Python socket programming tutorial beginners”, then “Python chat app socket threading tutorial”. For the advanced GUI, search “Flask SocketIO real-time chat tutorial” or “Python tkinter chat application tutorial”.
